

CS 3210 Design and Analysis of Algorithms, Programming Assignment 1

Given a set of n axis parallel rectangles, we want to find the area of the union of the rectangles (the shaded area). Design and implement an efficient algorithm to perform this. Note that you cannot compute the area as the sum of the areas in most cases.

Note: You can use C, C++ , Java to code but NOT Python

Input/Output specifications : Your inputs should be presented in a file containing the description of the n rectangles and the output will be the total area covered by the union.
